

# CSA RISK-BASED VALIDATION CHECKLIST

|                            |                                                                                      |                                                                                                        |                                                                                                     |
|----------------------------|--------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------|
| 1. Determine GxP Relevance | <input checked="" type="checkbox"/> Is the system involved in regulatory compliance? | <input checked="" type="checkbox"/> Does it impact patient safety, product quality, or data integrity? |                                                                                                     |
| 2. Define Intended Use     | <input checked="" type="checkbox"/> What is the purpose of the system?               | <input checked="" type="checkbox"/> Who uses it, and how?                                              |                                                                                                     |
| 3. Perform Risk Assessment | <input checked="" type="checkbox"/> Score risk = Impact × Likelihood                 | <input checked="" type="checkbox"/> Identify GxP-critical functionalities                              | <input checked="" type="checkbox"/> Determine risk mitigation actions                               |
| 4. Apply CSA Principles    | <input checked="" type="checkbox"/> Leverage vendor documentation where applicable   | <input checked="" type="checkbox"/> Focus testing effort on high-risk and custom features              | <input checked="" type="checkbox"/> Use unscripted testing for exploratory coverage when applicable |
| 5. Document Efficiently    | <input checked="" type="checkbox"/> Avoid redundant or boilerplate documents         | <input checked="" type="checkbox"/> Use concise checklists and evidence-based documentation            | <input checked="" type="checkbox"/> Focus only on what matters—avoid validating everything          |
